Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A process for configuring a symmetric xDSL-type modem, comprising:

detecting a predetermined criterion corresponding to an asymmetric operating mode, in particular of an ADSL-type; wherein detecting such criterium criterion including the includes obtaining an estimation of a length of a line; and

in response to said detection, disabling a number of carriers in order to establish the asymmetric operating mode.

- 2. (Currently Amended) A configuration process according to claim 1 wherein it-said process is applied to a VDSL-type modem operating with up to 4096 carriers and being reconfigurable in ADSL mode with a number of carriers reduced to 256.
- 3. (Currently Amended) A configuration process according to claim 1 wherein said detection of said criterion further includes a detection of signals defined in recommendation G.994.1 or the a measurement of the signal to noise ratio per carrier.
- 4. (Currently Amended) A configuration process according to claim 1 wherein said predetermined criterion is the estimation of the line length_derived from a timing advance measurement.
- 5. (Original) A configuration process according to claim 1, further comprising deactivating a cyclic suffix in a transmit path and digital power spectral density

shaping filtering for conformity to an ADSL-type mask, associated with a digital echo suppression filter and a temporal equalizer in a receive path.

6. (Original) A configuration process according to claim 2 wherein in ADSL mode, the configuration process comprises:

in a transmit path:

activating a digital power spectral density shaping filter (PSF) for conformity with an ADSL-type mask;

deactivating a process for inserting a cyclic suffix after each symbol to be transmitted;

activating a H⁻¹(f) pre-compensation before an inverse Fourier transform allowing to compensate for a phase and amplitude distortion introduced by said digital PSF; and in a receive path, activating a digital echo suppression filter and temporal equalizer.

7. (Currently Amended) An xDSL-type modem allowing symmetric operation in DMT mode based on a number of carriers, comprising:

means for detecting a predetermined criterion for operation in an asymmetric mode, in particular of an ADSL-type mode, wherein said means for detecting such criterion including includes means for obtaining an estimation of a length of a line; and

means for controlling disablement of a number of carriers in order to establish the asymmetric operating mode.

8. (Currently Amended) A modem according to claim 7, further comprising means for communicating in VDSL mode and means for self-configuring in ADSL mode in response to detection of said predetermined criterion.

Application No. 10/813,991 Reply to Office Action dated May 15, 2007

- 9. (Currently Amended) A modem according to claim 7 wherein said detection of said criterion is a detection of signals defined in recommendation G.994.1 or the a measurement of signal to noise ratio per carrier.
- 10. (Currently Amended) A modem according to claim 7 wherein said predetermined-criterion is an-the estimation of a-the line length derived from a timing advance measurement.
- 11. (Original) A modem according to claim 7 wherein in ADSL mode, the modem comprises:

in a transmit path:

a digital power spectral density shaping filter (PSF) that can be disabled, for conformity to an ADSL-type mask;

means for pre-compensating phase and amplitude distortion introduced by said digital PSF filter;

means for deactivating insertion of a cyclic suffix after each symbol to be transmitted;

in a receive path:

- a digital echo suppression filter (ESF) combined with a digital time-domain equalizer.
- 12. (Original) A modem according to claim 11 wherein said power spectral density shaping filter (PSF) and echo suppression filter (ESF) are infinite impulse response low-pass filters.
- 13. (Original) A modem according to claim 11 wherein said PSF and ESF filters are identical.

- 14. (Original) A modem according to claim 11, further comprising in the transmit path, a complex gain element before modulation, in order to pre-compensate for distortion introduced by said PSF and ESF filters.
- 15. (Original) A modem according to claim 7 wherein switching from ADSL mode to VDSL mode is accomplished in response to user control.
 - 16. (Currently Amended) A method, comprising:

configuring a modem for interoperability between first and second xDSL operating modes;

detecting a criterion associated with the first operating mode, wherein detecting such criterion includes obtaining an estimation of the length of the a line; and in response to the detected criterion, disabling a number of carriers associated with the second operating mode to establish the first operating mode.

- 17. (Currently Amended) The method of claim +16 wherein detecting the criterion includes estimating a measure of said line length derived from a timing advance measurement.
- 18. (Currently Amended) The method of claim <u>+16</u> wherein detecting the criterion includes detecting signals associated with the first operating mode.
- 19. (Currently Amended) The method of claim +16 wherein disabling the number of carriers associated with the second operating mode to establish the first operating mode includes disabling a number of carriers associated with a VDSL-type operating mode to establish an ADSL-type operating mode.
 - 20. (Currently Amended) The method of claim +16, further comprising: deactivating a cyclic suffix for a transmit path; and

digital signal processing based on a power spectral density shaping filter for the transmit path and based on a digital echo suppression filter and a temporal equalizer for a receive path.

- 21. (Currently Amended) An apparatus, comprising:
- a modem to interoperate between first and second xDSL modes;
- a first component of the modem to detect a criterion associated with the first mode, wherein detection of such criterion including includes the an estimation of the a length of the a line; and

a second component of the modem to disable a number of carriers associated with the second mode to establish the first mode, in response to the criterion detected by the first component.

- 22. (Currently Amended) The apparatus of claim 21 wherein the first component to detect the criterion can determine a measure of <u>said</u> line length derived from a timing advance measurement.
- 23. (Original) The apparatus of claim 21 wherein the first component to detect the criterion can detect at least one signal associated with the first operating mode.
- 24. (Original) The apparatus of claim 21 wherein the first mode comprises an ADSL-type operating mode, and wherein the second mode comprises a VDSL-type operating mode.
 - 25. (Original) The apparatus of claim 21, further comprising:
 - a digital power spectral density shaping filter;
- a pre-compensation unit coupled to the digital power spectral density shaping filter to pre-compensate phase and amplitude distortion introduced by the digital power spectral density shaping filter;

a deactivation unit to deactivate insertion of a cyclic suffix after each symbol to be transmitted; and

a digital echo suppression filter coupled to a digital time-domain equalizer.

- 26. (Original) The apparatus of claim 25 wherein the digital power spectral density shaping filter and echo suppression filter comprise infinite impulse response filters.
- 27. (Original) The apparatus of claim 25, further comprising a complex gain element before modulation to pre-compensate for distortion introduced by the digital power spectral density shaping filter and the digital echo suppression filter.
 - 28. (Original) The apparatus of claim 21, further comprising:
 a means for signal processing along a transmit path of the modem;
 a means for signal processing along a receive path of the modem; and
 a means for controlling switching operation between the first and second modes.
